Gene Rx with Voretigene Neparvovec (Luxturna®)

Patient Eligibility Criteria

EU Indication¹:

“Voretigene neparvovec is an adeno-associated virus vector-based gene therapy indicated for the treatment of adult and pediatric patients with vision loss due to inherited retinal dystrophy caused by confirmed biallelic *RPE65* mutations and who have sufficient viable retinal cells.”

Retinal cell viability in practice:

- presence of outer retinal cells on SD-OCT as determined by IRD specialist
- presence of at least Light Perception vision
- some additional measurement of visual function desirable e.g. FST

Abstract

Purpose: To report an anatomic change following subretinal injection of voretigene neparvovec-rzyl (VN) for RPE65-mediated Leber congenital amaurosis.

Design: Multicenter, retrospective chart review.

Participants: Patients who underwent subretinal VN injection at each of 4 participating institutions

Methods: Patients were identified as having perifoveal chorioretinal atrophy if (1) the areas of atrophy were not directly related to the touch-down site of the subretinal cannula; and (2) the area of atrophy progressively enlarged over time. Demographic data, visual acuity, refractive error, fundus photographs, OCT, visual fields, and full-field stimulus threshold (FST) were analyzed.

Main outcome measures: Outcome measures included change in visual acuity, FST, visual fields, and location of atrophy relative to subretinal bleb position.

Results: A total of 18 eyes of 10 patients who underwent subretinal injection of VN were identified as having developed perifoveal chorioretinal atrophy. Eight of 10 patients (80%) developed bilateral atrophy. The mean age was 11.6 years (range, 5-20 years), and 6 patients (60%) were male.

Baseline mean logarithm of the minimum angle of resolution visual acuity and FST were 0.82 (standard deviation [SD], 0.51) and -1.3 log cd.s/m² (SD, 0.44), respectively. The mean spherical equivalent was -5.7 diopters (D) (range, -11.50 to +1.75 D). Atrophy was identifiable at an average of 4.7 months (SD, 4.3) after surgery and progressively enlarged in all cases up to a mean follow-up period of 11.3 months (range, 4-18 months). Atrophy developed within and outside the area of the subretinal bleb in 10 eyes (55.5%), exclusively within the area of the bleb in 7 eyes (38.9%), and exclusively outside the bleb in 1 eye (5.5%). There was no significant change in visual acuity ($P = 0.45$). There was a consistent improvement in FST with a mean improvement of -3.21 log cd.s/m² ($P < 0.0001$). Additionally, all 13 eyes with reliable Goldmann visual fields demonstrated improvement, but 3 eyes (23.1%) demonstrated paracentral scotomas related to the atrophy.

Conclusions: A subset of patients undergoing subretinal VN injection developed progressive perifoveal chorioretinal atrophy after surgery. Further study is necessary to determine what ocular, surgical delivery, and vector-related factors predispose to this complication.

Keywords: Chorioretinal atrophy; Complications; Gene therapy; Leber congenital amaurosis; Luxturna; Outcomes Research; Subretinal injection; Voretigene neparvovec-rzyl.

EURETINA 2024 (September 19–22, Barcelona, Spain)

Patient disposition, demographics, and treatment characteristics

- A total of 291 patients were enrolled, of whom all patients received VN
- The mean age (SD)* of the patients was 23.7 (14.8), range (1–72) years. More than half of the patients were adults (58.4%) and males (52.2%)
- The mean (SD) length of follow-up was 1.87 (1.09) years (Maximum: 4.4 years)
- Patients were enrolled from 24 countries. The majority of them were from Italy (14.1%), France (12.7%), Germany (11.3%), Spain (10.3%), and the UK (8.9%)
- The recommended dose of 300 µL was administered in 462 eyes (87.7%); 51 eyes (9.7%) received a dose less than and 12 eyes (2.3%) received a dose more than 300 µL

Proportion of patients (%) from different countries (FAS, N=291)

- A total of 527 eyes (90.5%) had received VN at the time of data cut-off
- In majority of cases, single retinotomy sites (385 eyes; 73.1%) and single bleb (398 eyes; 75.5%) were created
- Deviations from the standard procedure were mainly the use of an automated injection system

FAS, full analysis set; N, total number of patients; SD, standard deviation; UK, United Kingdom; VN, voretigene neparvovec.

*Age is defined as age at time of study enrollment.

Data cut-off: Aug 31, 2023. FAS includes all enrolled individuals who received VN in at least 1 eye and provided informed consent; FAS is used to summarize all data.

Ocular AEs and AESIs

- Ocular AEs were reported in 186 patients (63.9%), affecting a total of 308 treated eyes (58.4%)
- Ocular AESIs occurred in 167 patients (57.4%), affecting a total of 274 treated eyes (52.0%)

Ocular AEs ≥2%

^aIncludes PTs: Retinal degeneration 74 (25.4%), injection site atrophy 19 (6.5%), retinal depigmentation 2 (0.7%), retinal dystrophy 2 (0.7%), injection site discoloration 1 (0.3%), macular degeneration 1 (0.3%). ^bIncludes IOP increased 49 (16.8%), ocular hypertension 6 (2.1%), glaucoma 1 (0.3%), intraocular pressure fluctuation 1 (0.3%). ^cIncludes eye inflammation 17 (5.8%), vitritis 13 (4.5%), iridocyclitis 3 (1.0%), uveitis 2 (0.7%), papilloedema 1 (0.3%), post procedural infection 1 (0.3%), retinal deposits 1 (0.3%). ^dIncludes PTs: Cataract 16 (5.5%), cataract subcapsular 5 (1.7%), lenticular opacities 2 (0.7%), ocular procedural complication 1 (0.3%). ^eIncludes PTs: Foveal degeneration 18 (6.2%), retinal degeneration 2 (0.7%), macular scar 1 (0.3%). ^fIncludes PTs: Epiretinal membrane 9 (3.1%), cystoid macular oedema 2 (0.7%), maculopathy 1 (0.3%), retinal haemorrhage 1 (0.3%), retinal thickening 1 (0.3%), retinoschisis 1 (0.3%), visual acuity reduced 1 (0.3%). ^gIncludes PTs: Drug ineffective 5 (1.7%), therapeutic product effect decreased 3 (1.0%), visual acuity reduced 1 (0.3%), visual impairment 1 (0.3%). ^hIncludes PTs: Retinal fovea disorder 6 (2.1%), disruption of the photoreceptor inner segment-outer segment 1 (0.3%), retinal depigmentation 1 (0.3%), visual acuity reduced 1 (0.3%). ⁱIncludes PTs: Retinal tear 6 (2.1%), ocular procedural complication 2 (0.7%). PTs are expressed as n (%); n=number of patients.

AE, adverse event; AESI, adverse events of special interest; IOP, intraocular pressure; MedDRA, Medical Dictionary for Regulatory Activities; N, total number of patient/eyes; n, number of patients/eyes; PT, preferred term.

Full analysis set. A patient/treated eye with multiple occurrences of an AE for PT is counted only once for each PT. All events including recurrences are counted in column for number of events. PTs are sorted by descending frequency in the "Patients" column. Ocular AEs in ≥2% patients are listed here by preferred terms. Ocular AESIs in ≥2% patients are listed here by terms of interest. MedDRA Version 26.0 was used for the reporting of AEs. AESIs were collected through a standardized safety questionnaire.

Chorioretinal atrophy, non-ocular, and serious AEs

Chorioretinal atrophy (CRA)

- CRA is an AESI that was reported based on investigator judgement
- There were 86 patients (29.6%) and 144 eyes (27.3%) with reported onset of CRA
- Females: n=50 (58.1%); Mean age:* 20.7 (range: 2–67) years
- Notably, 12 eyes had at least one event that involved the fovea, while 127 eyes (91.4%) had no such events
- Ninety-three eyes (67.9%) had at least one event that affected the macula and arcade
- Seventy-seven eyes (56.2%) had at least one event that affected the retina outside the posterior pole
- Ninety-eight eyes (74.8%) had at least one event at the injection site
- Seventy-three eyes (56.6%) had at least one event that affected inside the bleb area, and in 53 eyes (41.1%), at least one event that was outside the bleb area

CRA by preferred terms

Preferred terms	Patients, N=291 n (%)	Eyes, N=527 n (%)	No. of events for eyes
Chorioretinal atrophy	86 (29.6)	144 (27.3)	162
Retinal degeneration	74 (25.4)	122 (23.1)	128
Injection site atrophy	19 (6.5)	26 (4.9)	26
Retinal depigmentation	2 (0.7)	3 (0.6)	3
Retinal dystrophy	2 (0.7)	2 (0.4)	2
Injection site discolouration	1 (0.3)	2 (0.4)	2
Macular degeneration	1 (0.3)	1 (0.2)	1

Non-ocular AEs

- Non-ocular AEs occurred in 31 patients (10.7%); most frequent was headache (n=9 patients; 11 events)

Ocular and non-ocular SAEs

- Ocular SAEs were reported in 14 patients (4.8%), affecting 18 eyes (3.4%), including retinal fovea disorder (n=2; 3 eyes), retinal degeneration (n=2; 4 eyes), and reduced visual acuity (n=3; 4 eyes)
- One non-ocular serious AEs (psychotic disorder) occurred in 1 patient

AE, adverse event; AESI, adverse event of special interest; CRA, chorioretinal atrophy; MedDRA, Medical Dictionary for Regulatory Activities; N, total number of patient/eyes; n, number of patients/eyes; SAE, serious adverse event.

*Age is defined as age at time of study enrollment.

Full analysis set. All events including recurrences are counted in column for number of events; MedDRA Version 26.0 was used for the reporting of AEs; AESIs were collected through a standardized safety questionnaire.

Visual function: FST (white light) and BCVA

- Mean FST at baseline was -7.20 db (348 eyes). An increase in mean white light sensitivity from baseline was observed as early as Month 1; the highest gain was at Year 4
- Sustained FST improvement was observed at Up to Year 4
- Mean BCVA at baseline was 1.15 LogMAR (504 eyes). No clinically meaningful change was observed in mean BCVA from baseline over time

FST (white light)

BCVA

BCVA, best-corrected visual acuity; db, decibel; FST, full-field light sensitivity threshold; LogMAR, logarithm of the minimum angle of resolution; n, number of treated eyes with non-missing data at baseline and the post-baseline time point.

Full analysis set; error bars indicate SD.

Visual function: FST (white light) by presence of CRA

- Mean FST at baseline was -6.77 db (103 eyes) and -7.38 db (245 eyes) for eyes with and without CRA, respectively
- Mean change of the sensitivity threshold from baseline was larger in treated eyes with CRA vs treated eyes without CRA, both indicating improvement

FST (white light) for eyes with CRA

FST (white light) for eyes without CRA

CRA, chorioretinal atrophy; db, decibel; FST, full-field light sensitivity threshold; LogMAR, logarithm of the minimum angle of resolution; n, number of treated eyes with non-missing data at baseline and the post-baseline time point; SD, standard deviation.
Full analysis set; error bars indicate SD.

Conclusions

Based on the Year 4 interim analysis, the PERCEIVE study demonstrates the safety and effectiveness of VN, which are generally consistent with the known safety profile of VN

A majority of patients showed sustained improvement in visual function over this 4-year observation period, including patients with reported events of AESI CRA

As the study progresses, such AEs and the long-term safety profile of VN will be better characterized

Furthermore, PERCEIVE will provide real-world evidence on the long-term durability of vision improvements observed with VN therapy

AE, adverse event; AESI, adverse event of special interest; CRA, chorioretinal atrophy; VN, voretigene neparvovec.

What Have We Learned Since?

Real-World Data

Trial Participant MLMT[®] Videos (Bilateral Testing)

Representative of clinical trial participant with a clinically meaningful score change of 2 from baseline

Baseline Visit
1 Lux (FAIL)

Year 1 Post-Treatment Visit
1 Lux (PASS)

Year 1 Post-Treatment Visit
1 Lux (PASS)

Year 9 Post-Treatment Visit
1 Lux (PASS)

The subject's Baseline passing light level was 10 Lux (Score 4) and Year 1 passing light level was 1 Lux (Score 6), representing a 2 Lux score change from Baseline at Year 1.

The same subject's passing light level was 1 Lux (Score 6) at Year 1 through Year 9, representing a 2 Lux score change from Baseline at Year 1 through Year 9. An error in the camera settings during the video recording of the test at 1 lux at Year 9 altered the video quality.

The camera adjusts the level and temperature of light that it captures. Because of this feature, there may be slight variations in hue when filming at low light levels (e.g., 1 lux). An error in this feature occurred at Year 9, resulting in reduced video quality. All videos shown were filmed at 1 lux.

Conclusions

- Persistent **improvements in ambulatory vision, light sensitivity, and visual field** are maintained for at least 5 years after VN administration in most OI and DI patients, and up to 8 and 9 years in OI and DI patients combined
- **Increased variability after 5 years** due in part to COVID-related missed visits limits interpretation beyond 5 years. However, mean changes in MLMT®, FST, and GVF remain above baseline
- Safety profile is generally consistent with vitrectomy and subretinal injection procedure:
 - No AEs of chorioretinal atrophy (CRA) were reported. However, clinical study reports from the entire clinical development program (Phase 1 through Phase 3) describe **findings similar to CRA in 5 subjects**, attributed to natural disease progression
 - One patient experienced an SAE of **acute myeloid leukemia (AML)** at year 7 resulting in death, assessed as unlikely related to VN or administration procedure
- Continued data collection up to the planned follow-up period of 15 years will facilitate further understanding of **long-term safety and efficacy** from one-time VN administration

Real-World Learnings from VN for *RPE65*-IRD

Conclusions

Voretigene Neparvovec (Luxturna[®]) works in AR *RPE65*-IRD

VN does not normalise visual function

Improvements continue after up to 9 yrs

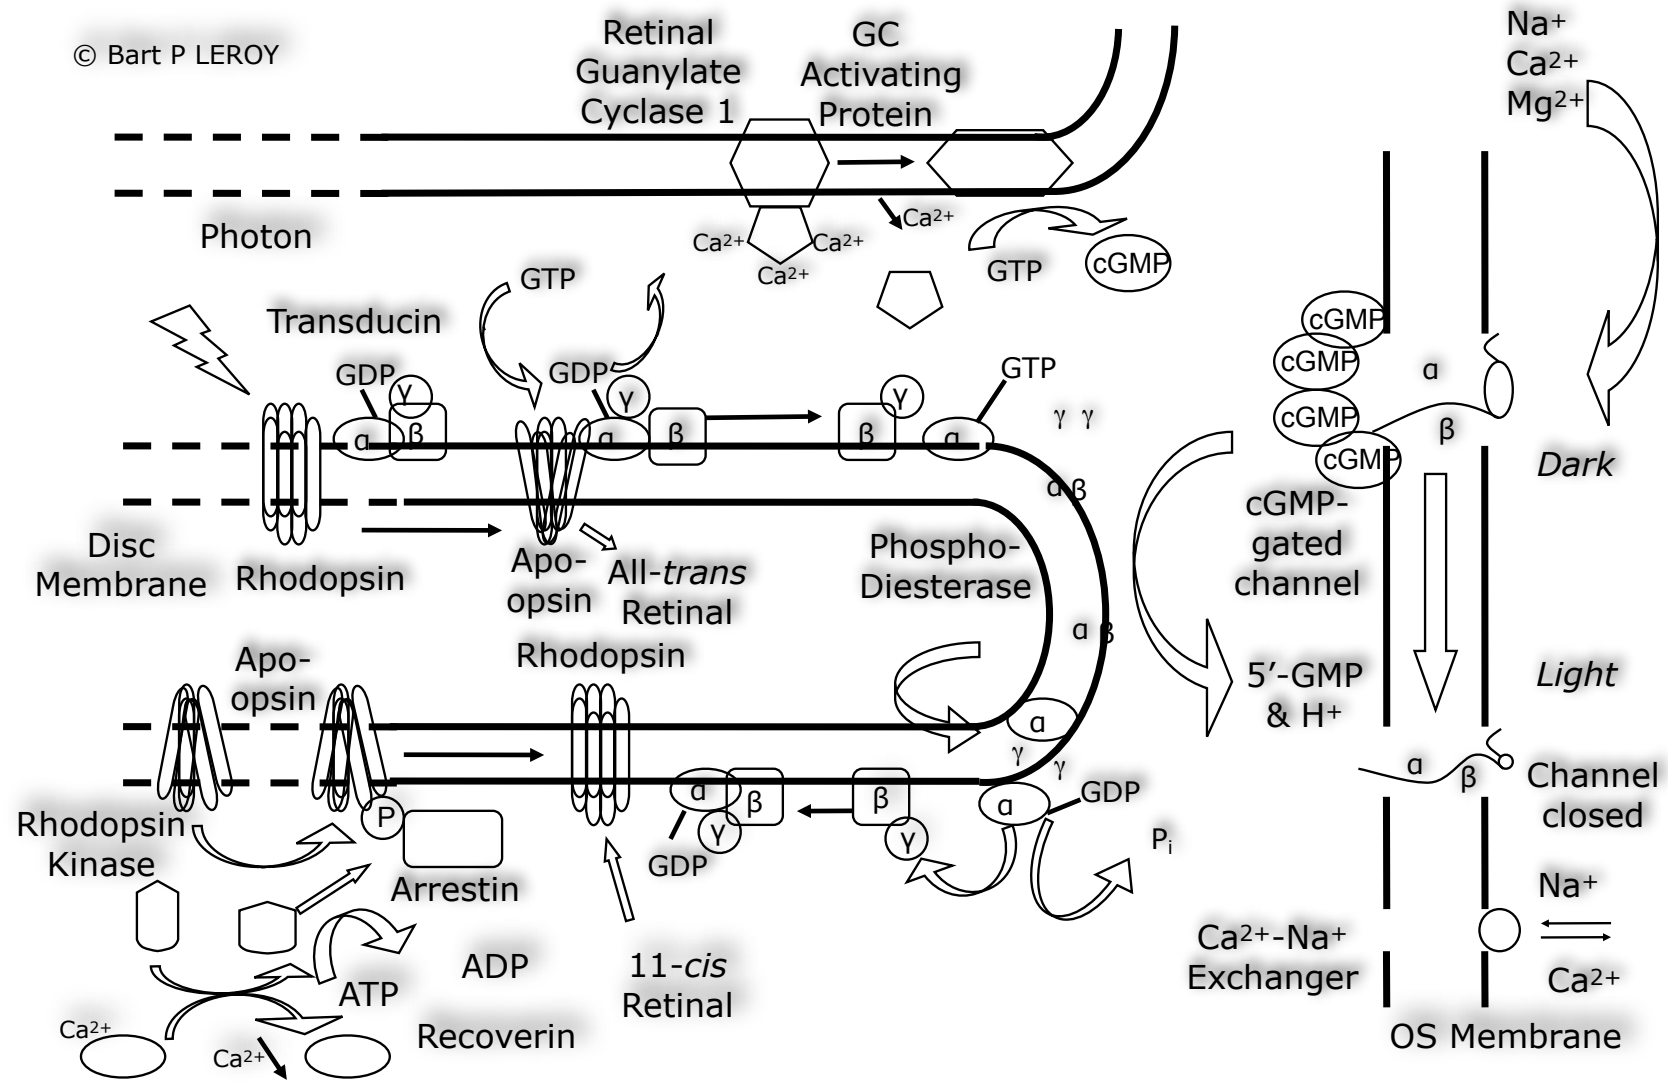

More beneficial when treated at younger age

Inflammation incompletely understood

Chorioretinal atrophy of 3 types requires further study

Gene Augmentation Therapy with AAV5
GUCY2D-LCA1

The Phototransduction Cascade

Gene Rx for *GUCY2D*-LCA

AAV5-hGRK1-*GUCY2D* (ATSN-101)

Safety and efficacy of ATSN-101 in patients with Leber congenital amaurosis caused by biallelic mutations in *GUCY2D*: a phase 1/2, multicentre, open-label, unilateral dose escalation study

Paul Yang, Laura P Pardon, Allen C Ho, Andreas K Lauer, Dan Yoon, Shannon E Boye, Sanford L Boye, Alejandro J Roman, Vivian Wu, Alexandra V Garafalo, Alexander Sumaroka, Malgorzata Swider, Iryna Viarbitskaya, Tomas S Aleman, Mark E Pennesi, Christine N Kay, Kenji P Fujita, Artur V Cideciyan

P Yang *et al*, Lancet, 404, 962-970, 2024

Gene Rx for *GUCY2D*-LCA

Methods

Phase 1/2, open-label, unilateral, dose escalation study

AAV5-hGRK1-*GUCY2D* (ATSN-101)

Subretinal injection

Recruitment from 2 sites (Penn & OHSU)

15 patients w/ clinical Dx of LCA1 w/ biallelic mutations in *GUCY2D*

Study eye 20/100 or worse (cohorts 1, 2, 3) or 20/80 or worse (cohorts 4, 5)

Dose escalation & dose expansion phases

Gene Rx for *GUCY2D*-LCA

Methods

Dose escalation phase: n = 3 for 3 doses: 1.0×10^{10} vg/eye (low), 3.0×10^{10} (middle dose) & 1.0×10^{11} vg/eye (high)

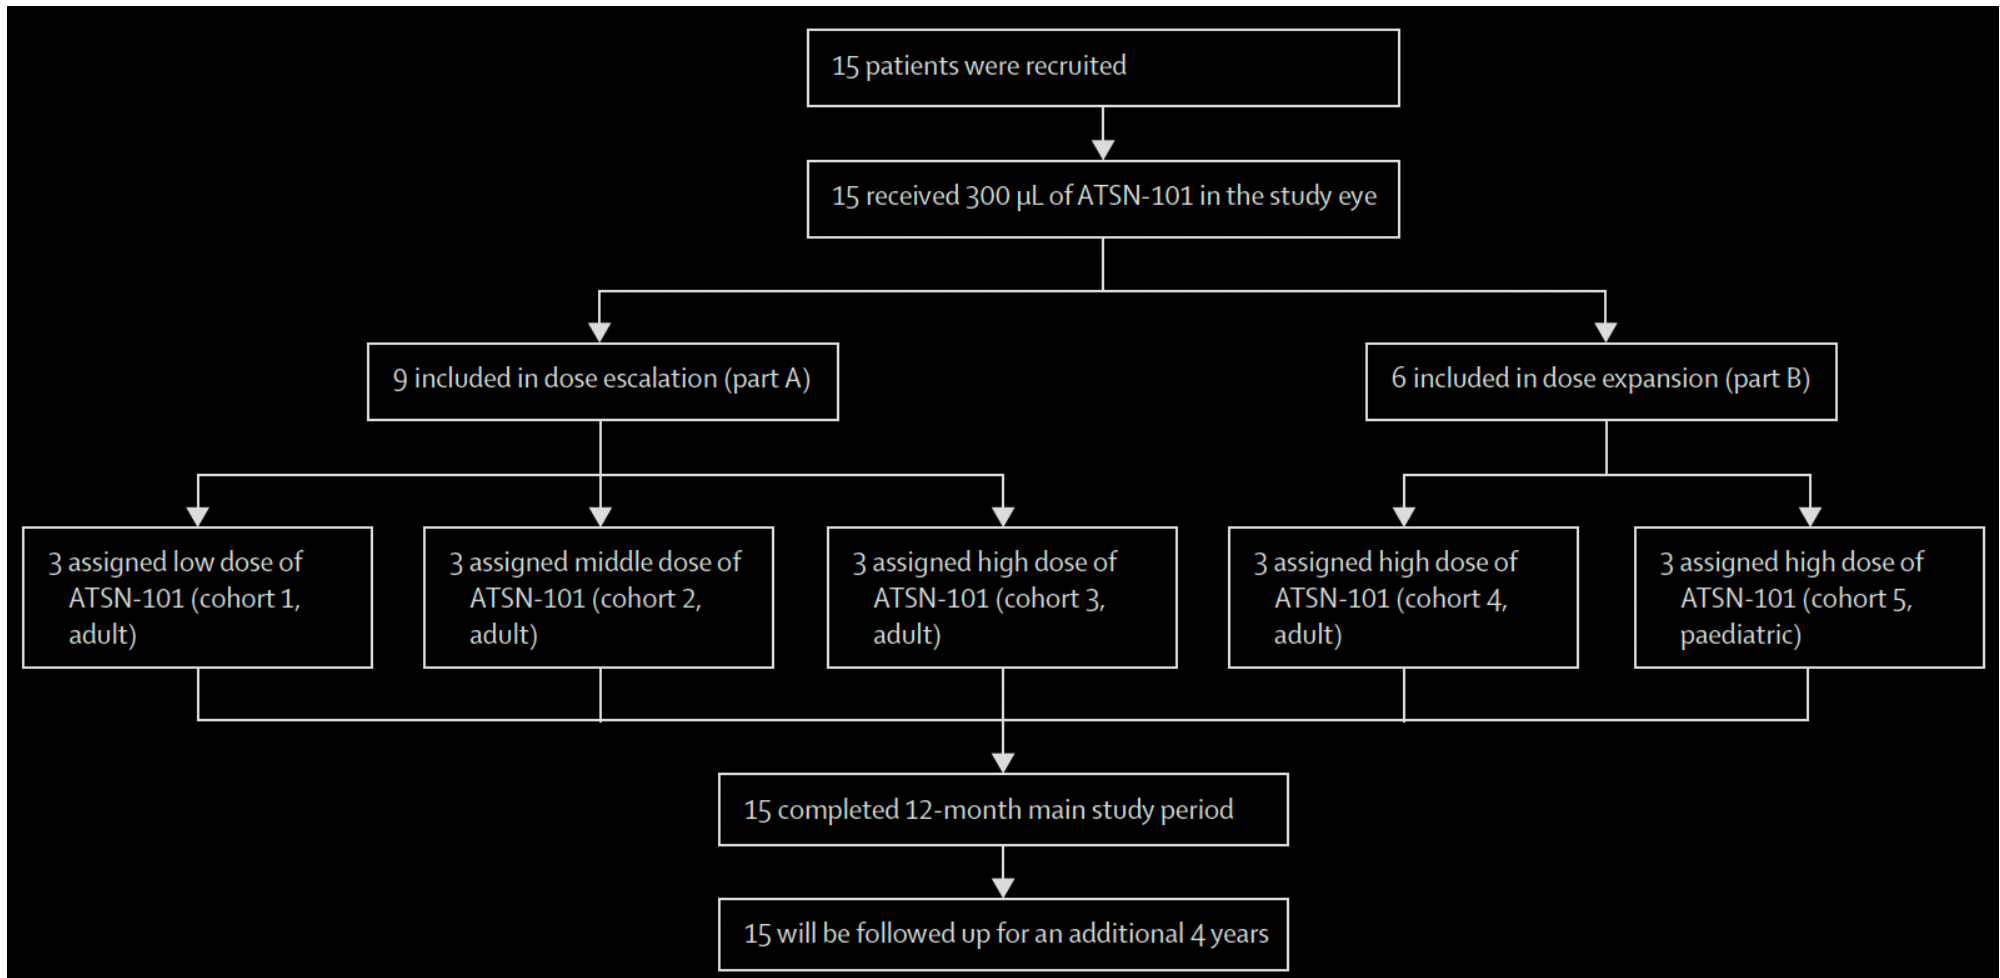

Dose expansion phase: n = 3 (adult) & n = 3 (paediatric) at high dose

Primary outcome = TEAEs

Secondary outcomes: BCVA, FST & MLMT

Gene Rx for *GUCY2D*-LCA

AAV5-hGRK1-*GUCY2D* (ATSN-101)

Gene Rx for *GUCY2D*-LCA

Results

68 TEAEs (56 surgery-related); no serious TEAEs

Only mild ocular inflammation

Patients who received high dose @ mth 12: mean change of FST 20,3 dB for treated, 1,1 dB for untreated eyes

Mild BCVA improvements ($p=0,10$)

3 of 6 high dose patients who did MLMT: highest score on MLMT

Gene Augmentation Therapy with AAV8

AIPL1-LCA4

Gene Rx for *AIPL1*-LCA *rAAV8.hRKp.AIPL1*

Gene therapy in children with *AIPL1*-associated severe retinal dystrophy: an open-label, first-in-human interventional study

Michel Michaelides*, Yannik Laich*, Sui Chien Wong, Ngozi Oluonye, Serena Zaman, Neruban Kumaran, Angelos Kalitzeos, Harry Petrushkin, Michalis Georgiou, Vijay Tailor, Marc Pabst, Kim Staeubli, Roni O Maimon-Mor, Peter R Jones, Steven H Scholte, Anastasios Georgiadis, Jacqueline van der Spuy, Stuart Naylor, Alexandria Forbes, Tessa M Dekker, Eugene R Arulmuthu, Alexander J Smith, Robin R Ali, James W B Bainbridge

Gene Rx for *AIP1*-LCA4

Methods

Phase 1/2, open-label, unilateral, single dose study

rAAV8-hRKp-*AIP1*

Subretinal injection

Recruitment from 1 site (MEH)

Specials Licence from Medicines & Health products Regulatory Authority (UK)

4 paediatric patients aged (1,0 - 2,8 yrs) w/ clinical Dx of LCA4 w/ biallelic mutations in *AIP1*

LP vision in both eyes (equivalent to 2,7 LogMAR)

Gene Rx for *AIP1*-LCA4

Methods

Outcomes =

BCVA with novel touchscreen test

Functional vision (observation of visual behaviour & ability to perform simple vision-guided tasks)

VEPs

Retinal structure (handheld OCT& widefield fundus images)

Gene Rx for *AIP1*-LCA4

Results

At age 3,0 - 4,1 yrs old

BCVA improved to LogMAR 0,8 - 1,0 (decimal equivalent 0,10 - 0,16) in treated eyes

BCVA in untreated eyes became unmeasurable

In 2 children old enough to reliably perform objective test showed objective improvement of BCVA & VEP

In 3 children, structural lamination of outer retina in treated eye better preserved than in untreated eye

In all 4 patients, retinal thickness in treated better than in untreated eye

Treated eye in 1 patient developed CMO; no other safety concerns

Approaches for Large Genes

Antisense OligoNucleotide (AON) Rx for *CEP290*-LCA10

LCA & IRD Genes Expression Patterns

CEP290-LCA10 Severe Phenotype

A

Retained central retinal photoreceptors & RPE disproportionate to low level of vision

Gene encompasses 54 exons w/ open reading frame of 7,440 bp) that exceeds typical cargo size (4.7 kb) of rAAV

Compound HeZ
p.Cys998X &
p.Glu1956GlyfsX9

Modified from
Walia et al. *Ophthalmology* 2010

Percentage of patients w/ very severe vision loss w/ best-corrected visual acuities= CF, HM, LP & NLP

High unmet medical need in LCA10

- Autosomal recessive retinal disease leading to severe and early vision loss
- Caused by mutations in the *CEP290* gene
- c.2991+1655A>G variant accounts for approximately 2,000 patients in the Western world
- The vision loss associated with LCA10 impacts quality of life of individuals living with the disease

A severe and early onset vision loss in LCA10 vs. other IRDs

There are currently no approved therapies for LCA10

BP Leroy, SR Russell, AV Drack, AV Cideciyan, SG Jacobson, AC Ho, C Van Cauwenbergh, J De Zaeytijd, AK Krishnan, W den Hollander, A Hollestein-Havelaar, MR Schwartz, A Girach: Safety and efficacy of sepofarsen in the second treated eye in the Phase 1b/2 extension trial in Leber congenital amaurosis due to mutations in the CEP290 gene (Insight Trial), *EURETINA 2021 Virtual Meeting*, 09-12/09/2021

Sepofarsen (17-mer AON) directed
against *CEP290* pre-mRNA

Intravitreal Injection

- Intravitreal injection - broad distribution
- Sepofarsen is 17-mer antisense oligonucleotide (AON) 160 µg/80 µg in 50 µl
- Effect not permanent - thus reversible

PQ-110-003 (Sepofarsen) Phase 2/3 Illuminate Trial

A Story of a Suboptimal Comparison

First year results: Illuminate did not meet primary endpoint of Best-Corrected Visual Acuity (BCVA) at Month 12 compared to sham procedure control group

Traditional analysis approach of TE vs sham is difficult to show Tx effect due to high variability & small N

However, when adjusting TE & sham eyes by subtracting effects of their corresponding CE, a numeric treatment difference between sepofarsen & sham is observed

- Consistent w/ Phase 1b/2 study results

- Individual participants demonstrated improvement from baseline in multiple endpoints

- Responses also seen in year 2 when 2nd eye/sham was treated

Overall good safety profile: no intraocular inflammation, no systemic effects

EMA & FDA recommended setting up another phase 2/3 trial prior to submitting Marketing Authorization Application

ProQR Therapeutics Announces Transaction Completed for Théa to Acquire Sepofarsen and Utevursen Ophthalmic Assets

Download PDF 

Divestment of sepofarsen and utevursen completed – Théa to continue development of sepofarsen and utevursen for patients with LCA10 and Usher syndrome

Agreement provides ProQR with initial payment of €8M and up to €165M in earn-out payments, as well as potential double-digit royalties based on commercial sales in the US and EU

Transaction supports ProQR's strategic focus on its proprietary Axiomer® RNA editing technology platform and continued advancement of pipeline

LEIDEN, Netherlands & CAMBRIDGE, Mass., Dec. 08, 2023 (GLOBE NEWSWIRE) --

ProQR Therapeutics N.V. (Nasdaq: PRQR) (ProQR), a company dedicated to changing lives through transformative RNA therapies, today announced it has completed a transaction divesting late stage ophthalmic assets, sepofarsen and utevursen, to Laboratoires Théa (Théa).

Approaches for Large Genes
Dual Vector Technology for
ABCA4-IRD (Stargardt Disease)
&
MYO7A-IRD (Usher Syndrome Type 1B)

AAVANTGARDE is a clinical-stage next-generation gene therapy platform company

2 Platforms

- **Large gene delivery**

Dual Hybrid AAV platform (validated in Akouos study)

Intein mediated Protein trans-splicing

- **Broad IP and exclusive license**

2 Programs

- **Usher syndrome 1B**

- AAVB-081 Luce study: First patient dosed in 2024; clinical PoC in 2025

MYO7A

- **Stargardt disease**

- AAVB-039 Stella natural history study & First-in-human studies in 2025; Clinical PoC in 2027
- Strong PC package including NHP data

ABCA4

Expansion opportunities

- **Pipeline expansion and BD opportunities**

Additional IRDs (Ophthalmology)

Pipeline ex-ophthalmology

Dual AAV hybrid platform

DNA splicing to generate a full-length protein

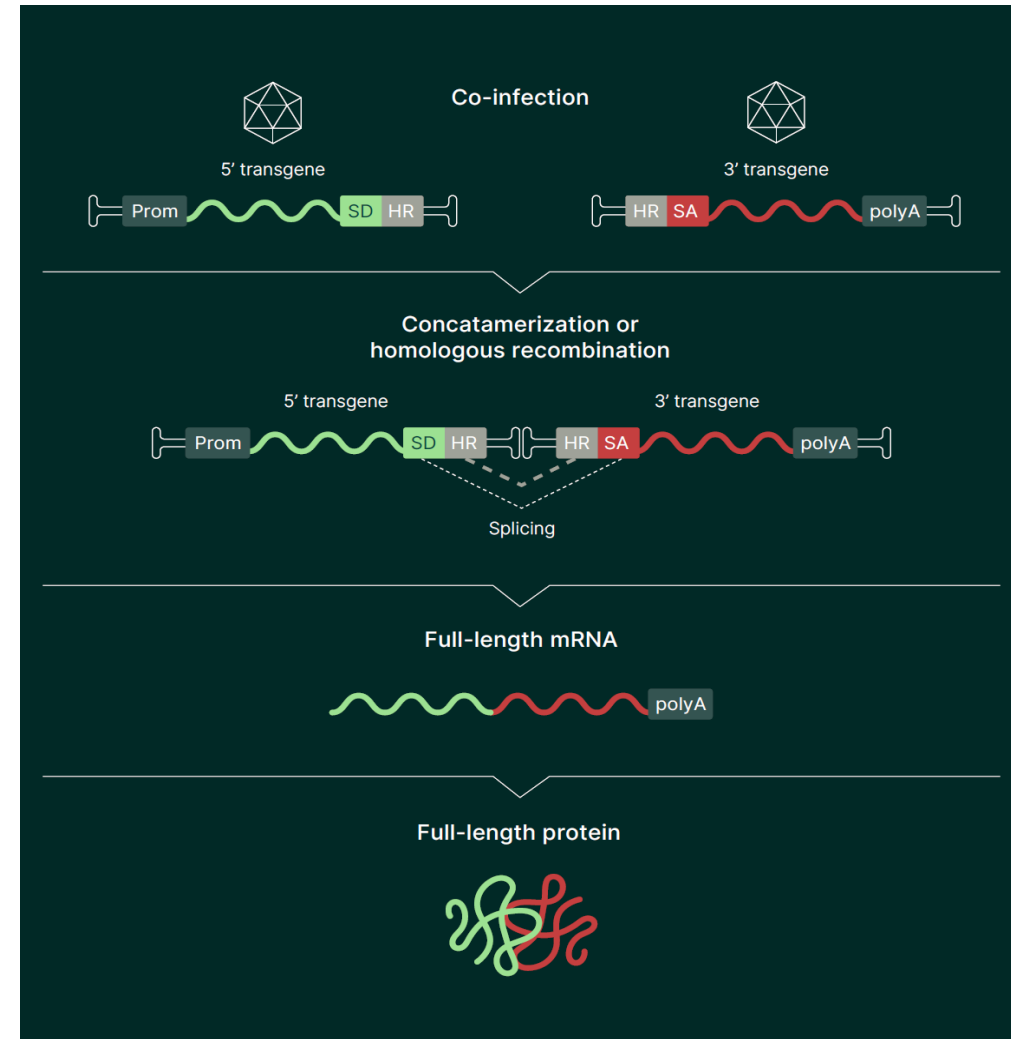

Uses **2 AAV vectors**, containing 5' or 3' halves of therapeutic gene

Works by **recombining DNA within cell**

Efficient recombination & versatile approach

Generates **therapeutically meaningful protein levels**

Usher 1B program

Intein-mediated platform

Protein trans-splicing to generate a full-length protein

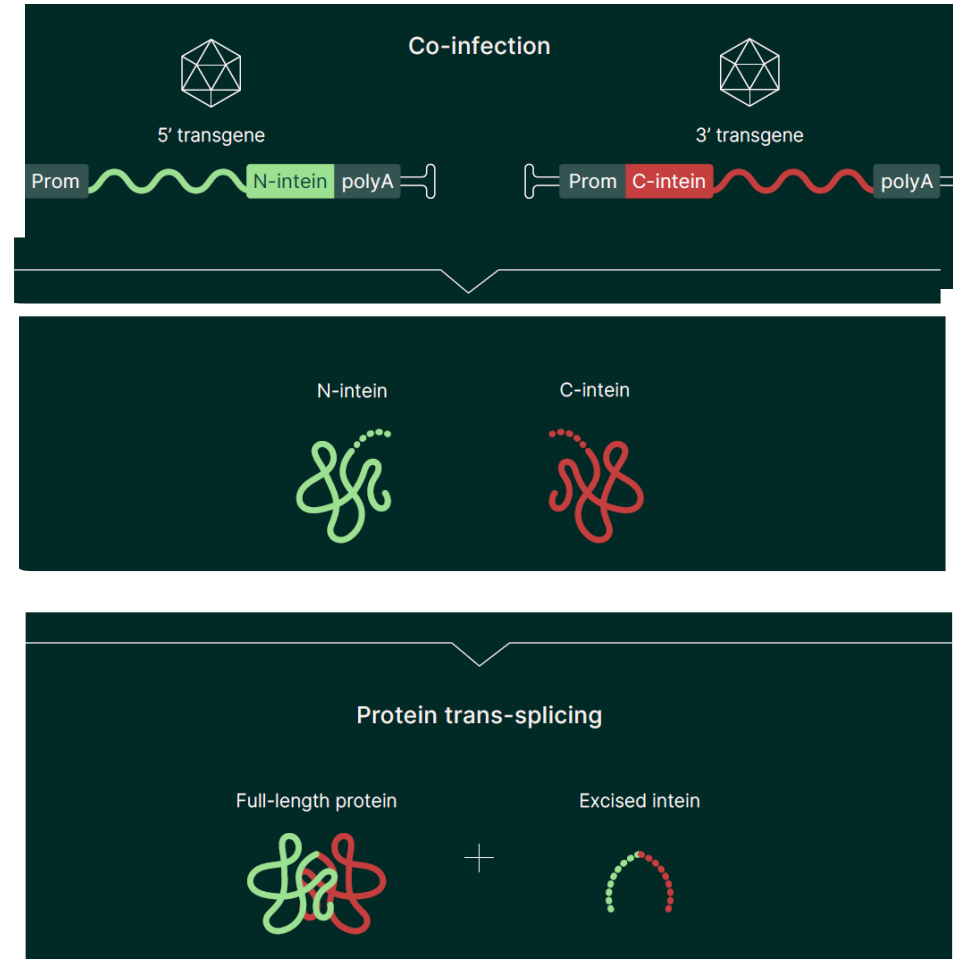

Uses **2 AAV vectors** encoding each for one of the halves of target proteins flanked by **short split inteins**

Works by **protein trans-splicing** within the cell

Demonstrated safety and very **efficient recombination** in different species (**mouse, pig and NHP**)

Delivers therapeutically meaningful protein levels

Stargardt program

SpliceBio Protein Splicing: a New Gene Therapy Modality

SpliceBio's Protein Splicing platform has demonstrated efficiencies of > 95%.

Generic Gene Therapy Approaches

Optogenetics

Genetic Therapy for IRDs

Conclusions

Rx for Genetic Retinal Disease

Need For Genotyping

Need for genotyping enormous:

Frequency of inherited retinal disease = $1/2500$

World population = 8.200.350.300 (Jan 2025)

3.281.000 patients (Jan 2025)

Gene-specific Rx feasible for everyone?

Perspectives of Patients, IRD Experts, Industry & Regulatory Bodies

Background

Patients want decrease in speed of degeneration, stability or improvement

IRD experts desire to help IRD patients keep function for as long as possible

Industry prefers an efficient treatment w/ return on investment

Regulatory agents need to see real-World evidence of improvement in activities of daily living

Genetic Therapies for IRDs

Overall Conclusions

Very recent field (+/- 20 yrs)

Gene Rx efforts are mushrooming (Luxturna® is 1st of many)

Genetic Rx requires intact target cells, works but is not perfect

A lot remains to be learned

A difficult path lies ahead, but future is bright

Urgent need to improve patient identification through systematic genotyping

Better understanding of CRA & inflammation required
